UNI ROOT

Everything begins with order

Before we count anything, there is already an arrangement. Numbers are not only quantities; they are positions in a cycle. The nine base numbers repeat again and again, and every repetition returns to its root.

When we look at numbers this way, three families appear: 1·4·7, 2·5·8 and 3·6·9. Each family moves with its own step, and together they close a full circle. This is what we call order: not how much, but where, and in which rhythm.

uni root starts from this idea. It reads the rhythm of ordered numbers and gives it two forms we can sense at once: rings of light that move, and layered tones that follow them. What you see and what you hear come from the same order.

Order is motion, not quantity. A session is that motion made visible for a while, with its silences and its clear ending.
